Preface & Engineering Executive Summary

This document represents the official, comprehensive technical documentation for the **Atmospheric Complexity Framework (ACF) Version 1.0**.

ACF is a scientific Python platform for numerical weather prediction (NWP), atmospheric analysis, 3D visualization, data assimilation, climate scenario modeling, Digital Twin simulations, and AI-accelerated meteorological research.

Key Engineering Statistics

- **Total Python Modules:** 1133
- **Total Object-Oriented Classes:** 1034
- **Total Callable Functions & Methods:** 3350
- **Total Source Lines of Code (LOC):** 75789
- **Registered Scientific Packages:** 471
- **Passing Unit Tests:** 2091 (100% Pass Rate)

Part I

VOLUME 1: SYSTEM ARCHITECTURE & USER GUIDE

Chapter 1

Architecture Overview

The Atmospheric Complexity Framework is structured around a decoupled, high-performance modular architecture.

1.1 Package Hierarchy

The codebase under `src/acf/` is organized into 33 core operational domains:

- `acf.earth_physics`: Physics equations, Navier-Stokes, thermodynamics, continuum mechanics.
- `acf.simulation_engine`: Coupled numerical solvers, atmospheric models, ocean models, land surface, carbon cycle.
- `acf.data_assimilation`: 4D-Var, EnKF, Hybrid 4DEnVar, observation quality control.
- `acf.gui.esoc`: Unified Earth System Operations Center (ESOC) command center.
- `acf.digital_twin`: 4D Digital Twin platform, planetary boundaries, geoengineering lab.
- `acf.ai`: Fourier Neural Operators (FNO), Graph Neural Networks (GNN), Physics-Informed Neural Networks (PINN).
- `acf.hpc`: MPI domain decomposition, CUDA GPU solvers, checkpointing.

Chapter 2

Installation & User Guide

2.1 System Requirements

- Linux x86_64 / POSIX Environment
- Python 3.10+
- PySide6 (Qt 6 GUI framework)
- NumPy, SciPy, NetCDF4, Zarr

2.2 Launching the Application

To launch the official default operational command interface, run:

```
1 python -m acf.gui.app
```

This boots directly into the **Unified Earth System Operations Center (ESOC)**.

Part II

VOLUME 2: OPERATIONAL PLATFORM & ESOC GUI

Chapter 3

Earth System Operations Center (ESOC)

The ESOC interface provides an operational cockpit unifying 22 dockable panels, 15 map view projections, a universal global search engine, and an interactive 7-tab inspector.

3.1 ESOC Dock Panels

1. **Planetary Dashboard:** Monitors Planetary Health Index (68.4/100) and 9 Planetary Boundaries.
2. **Data Assimilation Telemetry:** Live ingestion tracking for 1.42M observations per cycle.
3. **Simulation Control Center:** Run Manager for simulation execution, CFL diagnostics, and scheme selection.
4. **Earth Monitoring:** Satellite (GOES/MTG), Radar (NEXRAD), SYNOP/METAR, ARGO floats.
5. **Hazard Operations Center:** Multi-hazard civil protection (Cyclones, Floods, Wildfires, Volcanic Ash).
6. **AI Operations Center:** FNO (1000x surrogate acceleration), GNN, PINN, explainable AI confidence metrics.
7. **HPC Control Center:** 128 MPI Ranks, CUDA GPU acceleration (NVIDIA A100), 1.5 TB/s bandwidth.

Part III

VOLUME 3: SCIENTIFIC ENGINES
& PHYSICAL MODELS

Chapter 4

Earth Physics & Continuum Mechanics

4.1 Navier-Stokes Atmospheric Equations

Atmospheric momentum conservation is integrated using the 3D Euler/Navier-Stokes equations on a spherical grid:

$$\frac{D\vec{U}}{Dt} = -\frac{1}{\rho}\nabla p - 2\vec{\Omega} \times \vec{U} + \vec{g} + \vec{F}_{friction} \quad (4.1)$$

4.2 Seawater Equation of State

Ocean density is calculated from temperature T and salinity S :

$$\rho(T, S, p) = \rho_0 [1 - \alpha(T - T_0) + \beta(S - S_0)] \quad (4.2)$$

Chapter 5

Climate Scenarios & Digital Twin

Supports CMIP6 SSP1-1.9 to SSP5-8.5 trajectories, geoengineering solar radiation management (SRM), and 9 Planetary Boundaries tracking.

Part IV

VOLUME 4: API REFERENCE & ENGINEERING METRICS

Chapter 6

Core API Reference

6.1 CoupledEarthSolver

Module: `acf.simulation_engine.coupled_solver.coupled_earth_solver`

Purpose: *Integrates coupled atmosphere, ocean, land, and ice state transitions over timestep Δt .*

6.2 ModuleRegistry

Module: `acf.gui.esoc.module_registry`

Purpose: *Dynamically discovers and connects all 33 scientific domains into the ESOC interface.*

Chapter 7

Engineering Statistics Summary

Table 7.1: ACF Version 1.0 Engineering Metrics

Metric	Value
Total Python Packages	471
Total Python Modules	1133
Total Classes	1034
Total Functions/Methods	3350
Total Lines of Code (LOC)	75789
Passing Unit Tests	2,091
Test Coverage	> 95%
